## Contents

<b>A Supplementary Material: mathematical description of the model</b>	<b>2</b>
<b>B Supplementary Material: extended description of the calibration of the model</b>	<b>5</b>
B.1 Definition of the objective function . . . . .	5
B.2 Random exploration of the parameter space employing a Monte-Carlo analysis . . . . .	5
B.3 Local optimization using a gradient search to fit the parameters' values to the data . . . . .	7
B.4 Exploring the possibility of an alternative RMS . . . . .	9
<b>C Supplementary Material: double heat shock characterization</b>	<b>10</b>
C.1 Simulating the double HS experiments to investigate their main features . . . . .	10
C.2 Extending the model to simulate the experiments on the double HS . . . . .	10
<b>D Supplementary Material: steady state characterization and further applications of the model</b>	<b>13</b>
D.1 Prolonged heat shock . . . . .	13
D.2 Stationary behaviour . . . . .	13
D.3 Relationship between HS temperature and HS duration in the production of HSP . . . . .	14
D.4 Discussion of additional results . . . . .	15
<b>E Supplementary Material: Robustness of the main results against changes in Hill kinetics parameters</b>	<b>17</b>
